

RELATIONSHIPS & ADJUSTMENT IN FAMILIES COPING WITH CANCER

Opportunity to Participate in a Research Study

Over 12,000 children are diagnosed with cancer in the US each year, and children and their families are faced with different types of stress after diagnosis. The aim of this study is to understand how parents and caregivers cope with stress after their child is diagnosed, and how support from social relationships may impact parent and family adjustment.

WHO IS ELIGIBLE?

- Parents/caregivers of children diagnosed with cancer in the last 12 months
- Parents should be at least 18 years old and speak English or Spanish

WHAT WILL I HAVE TO DO?

- Complete some short questionnaires about your child, your coping, and your relationships.
- You can participate in-person at Dell Children's Hospital, at UT, or by phone or online.

WHY SHOULD I PARTICIPATE?

Your participation can help us learn more about how parents cope with cancer, and may help other families cope with cancer in the future.
